Visual cross-check of resting-state clustering

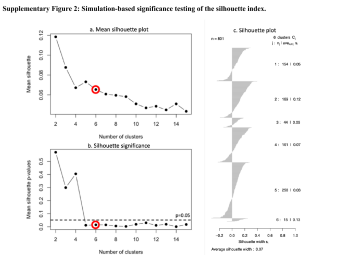

FOR2107 compared with Tozzi et al.

Same layout, different information content: the paper combines rest and task-derived circuit scores; our panels use the 14 resting-state edges currently available.

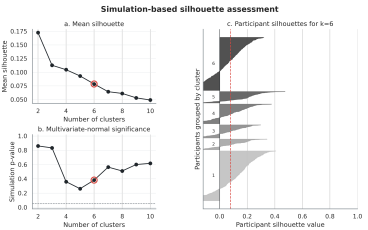

Preliminary comparison · five- and six-cluster descriptive solutions · 1 September 2026

Supplementary Figure 2: how convincing is the separation?

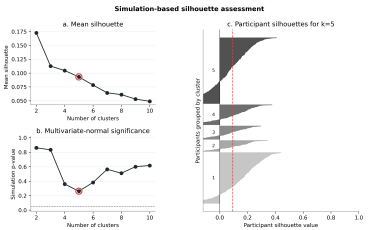

Tozzi et al.

FOR2107 · k = 6

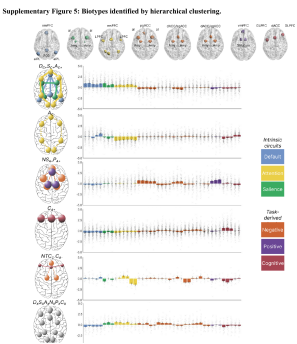

FOR2107 · k = 5

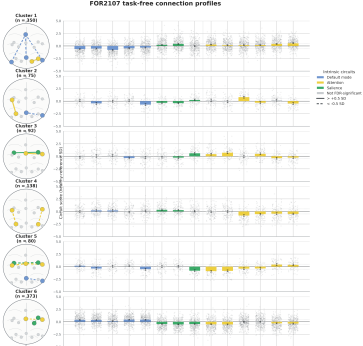

Supplementary Figure 5: what do the cluster profiles look like?

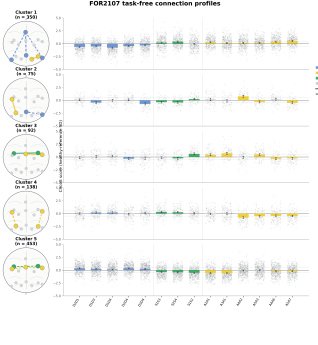

Tozzi et al.

FOR2107 · k = 6

FOR2107 · k = 5

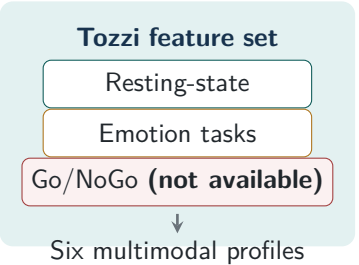

Why an exact replication needs Go/NoGo data

The missing task removes a defining part of the experiment.

Tozzi's biotypes were built from a combined profile of resting-state connectivity, task connectivity, and task activation.

The Go/NoGo task supplied the cognitive-control features that distinguished several of the reported six profiles.

Without Go/NoGo: no exact Tozzi replication.

We can test a resting-plus-emotion adaptation, but its cluster count and biotype labels would be a new scientific result—not a replication.
